BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This sequence represents TTH2 peptide, derived from the purified alpha subunit (encoded by the dnaE gene) of a novel Thermus thermophilus calpha subunit (encoded by the dnaE gene) of a novel Thermus thermophilus thermostable DNA polymerase holoenzyme which corresponds to DNA colymerase in the peptide was used to design primers (AAZ30923-Z30924) for PCR of the dnaE gene. Pol III-type caybes have a high processivity (>50 kb) and rapid rate of synthesis (750 nucleotides/s). Pol III consists of 18 subunits of 10 different capha (DNA polymerase) core is the catalytic unit and consists of the alpha (DNA polymerase). Pol III consists of 18 subunits of 10 different care the beta subunit ("sliding clamp") is ring-shaped and encircles DNA and It is the beta subunit which is responsible for the high processivity can speed. The gamma complex (composed of gamma, deltar, deltar, chi and seed. The gamma complex (composed of gamma, deltar, deltar, chi and casembly of beta clamps around DNA. A dimer of the tau subunit acts as a seasombly for beta clamps around DNA. A dimer of the two cores within pol colymerase and one molecule of gamma complex, forming the Pol III*

Colymerase and one molecule of gamma complex, forming the Pol III*

The present invention describes a nucleic acid which encodes an anti-My-10 antibody. The present sequence represents the CDR-2 of the H chain variable region of the antibody. Also described is a method for the production of a recombinant antibody in which the above nucleic acid is used to produce an antibody which combines with human CD34 antigen by gene recombination. The anti-CD34 antibody gene is used to produce recombination the anti-CD34 antibody gene is used to produce recombinant anti-CD34 antibody which can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          conserved proteobacterial extracellular domains. Sequences AAB5158 - AAB51618 represent peptides homologous to Yadh, a yersinia adhesin which is an important virulence determinant of the Yersinia species. The invention includes an antibody which binds to the proteobacterial extracellular peptides, and an immunogenic composition proteobacteria. The polypeptides and antibodies are useful in the rearment and prevention of proteobacterial infection by a proteobacteria. The polypeptides and antibodies are useful in the can also be used to identify compounds which antagonize the binding of a bacterial adhesion to its ligand. The host cell can be used to produce the polypeptides in a suitable culture system. The composition can be used to vaccinate a patient against a proteobacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to peptides AAB51512 - AAB51537 which represent conserved proteobacterial extracellular domains, Sequences AAB51618 represent beptides homologues to vada

The fragments were used to generate the primers AAT08084-97 used for cloning the full length gene encoding the alpha-1,3/4-fucosidase. The gene can be used to transform the stress of E.coli, animal or plants cells, to produce alpha-1,3/4-fucosidase. The protein can be used for determining the structure and function of sugar chains or

This invention relates to peptides AAB51512 - AAB51537 which represent conserved proteobacterial extracellular domains. Sequences AAB51618 represent peptides homologous to YadA, a yersinia adhesin which is an important virulence determinant of the Yersinia species. The invention includes an antibody which binds to the proteobacterial extracellular peptides, and an immunogenic composition containing the antibody used as a vaccine to prevent infection by a proteobacteria. The polypeptides and antibodies are useful in the treatment and prevention of proteobacterial infections. The polypeptides can also be used to identify compounds which antagonize the binding of a bacterial adhesion to its ligand. The host cell can be used to produce the polypeptides in a suitable culture system. The composition can be used to vaccinate a patient against a proteobacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           An isolated polypeptide conserved in proteobacterial extracellular domains used in the treatment and prevention of bacterial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        oxidation; cyclitol; cyclitol-ubiquinone oxidoreductase; synthesis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                   Amylogenin or self glucosylating protein (SGP) is a starch primer. It can be purified from the endosperm of a US inbred line (B73) of Zea mays. The protein was then digested with trypsin in an enzyme/substrate ratio of 1.25 for 15 hr. The tryptic digest was fractionated. Nine of the peptide peaks (labelled P1-P9) were tryptic peptide peaks were obtd. Nine of the purified a number of peptides were chosen for As sequence analyses (labelled tryptic The sequences of these peptides is given in AAR49682-90. The radiolabelled peptide T2 is a proteolytic fragment of the larger radiolabelled peptide T6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide #10124 encoded by human foetal liver single exon probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 27; SEQ ID NO 35253; 639pp + sequence listing; English.

                                                                                                                                                                                                                                                                                                      In preparate sequences survent to control of the analysis and their derivatives. The enzyme, a cyclitol-ubiquinone oxidoreductase, has a molecular weight of 87 kD. bnA sequences derived by reverse translation of the partial peptide sequences were also generated (see AAT96607-26). The enzyme is useful as a catalyst for the analysis and synthesis of ketcoyclitol epimers, especially inoscose epimers, preferably using coenzyme Q. It is also useful as an antigen for antibody production or analysis and for use in immunoassays. The corresponding CDNA is useful for the analysis and synthesis of molecular-biological equivalence structures and associated

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide #10469 encoded by probe for measuring placental gene expression.
                                                                                                                                Human bone marrow expressed probe encoded protein SEQ ID NO: 36629.
                                                                                                                                                             Human; bone marrow expressed exon; gene expression analysis; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of

                                                                                                                                                                                                                                      The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

THE STATE OF THE S

```
surface protein A (PspA) protein from Streptococcus possible and surface protein A (PspA) protein from Streptococcus possible a fusion recombinant DNA molecule has been developed which encodes a fusion protein comprising a truncated form of PspA and cholera toxin B subunit (TTB), where the DNA molecule comprises a nuclectide sequence encoding the truncated PspA inked by an in-frame genetic fusion to a ctxB gene, and where the truncated PspA contains immunoprotective epitopes and up to 90% of the whole PspA protein, except for the cell membrane anchor region. The fusion protein is useful for providing an immunogen to proteins of this strain are not immunogenic enough to provide protection. The antigenic epitopes of the fusion protein are directed against capsular polysaccharide antigens of S.pneumoniae, specifically it contains the protective epitopes of PspA. The protein can also be used in solid-phase immunoadsorbent assays, since it is readily bound to supports coated with monosialoganglioside GMI. The fusion protein is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptococcus pneumoniae strain Rx1; pspA; immunoprotective; immunogen; pneumococcal surface protein A; cholera toxin B subunit; fusion protein;
subjects before surgery or insertion of an in-dwelling device (alternatively the device itself is impregnated before placement). The nucleic acid sequence is used as sources of antisense sequences (for therapeutic use) or regulatory elements for controlling expression of bacterial genes, and for antibacterial screening. The protein can be also used as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present sequence represents an N-terminal peptide of pneumococcal

The protein is used to generate antibodies and to screen for antimicrobials. The products are used to treat or prevent bacterial infections, particularly where caused by S. aureus but also against Helicobacter pylori. Particular applications are to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid from Staphylococcus aureus NCIMB 40771 - useful for, e.g. diagnosis, prevention and treatment of bacterial

                                                                                  ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunoprotective pneumococcal surface protein A (PSpA) N-terminal sequence. The present invention also describes a method of forming the immunoprotective truncated PspA, comprising incorporating a vector bacterium via transformation. (I) is used to design primers which are capable of detecting a large number of S. pneumoniae strains, which in turn can be used to diagnose pneumococcal infection in mammals (e.g. humans), independent of the strain which has caused it. The PspA protein is used to develop a vaccine against pneumococcal infection comprising, as an immunologically active component, a live attenuated or killed bacteria containing a gene coding for the truncated form of PspA.
                                                                                   Gaps
more immunogenic against S.pneumoniae than using PspA alone as the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the

This truncated protein contains the antibody and antigen of the complete protein contains the excludes the cell-membrane anchor region) fused to the B subunit of cholera toxin (CTB) which is bound to monosialogangloside (GMI) coated on the substrate. The use of a fusion between truncated PspA and cholera toxin B subunit (CTB) allows the support to be coated without having to isolate PspA fragments since CTB binds specifically to the GMI coating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cellulytic enzyme; endoglucanase; hydrolysis; cellulose; microorganism; plant cellulase; catalytic region; textile; backstaining; bio-polishing;

AAW04938-W04963 represent partial endoglucanase sequences. These peptides are examples of fragments of the enzymes of the invention (see AAW04925 for an example of a full length enzyme of the invention). The full length enzyme of the invention). The full length enzymes possess cellulytic (particularly endoglucanase) activity. Cellulytic enzymes are involved in the hydrolysis of cellulose, and are synthesised by a large number of microorganisms and plants. The enzymes of the invention containing the conserved catalytic regions (such as AAW04913) exhibit improved performance, e.g. 50 times higher performance, compared to multiple domain enzymes. The enzymes can be used for the treatment of fabrics or textiles, preferably for preventing backstaining, for blo-polishing or for stone-washing cellulosic fabric. They can also be used for the degradation or modification of plant material, such as cell walls. They can also be used in the treatment of paper pulp preferably for debarking, defibration, fibre modification, enzymatic de-inking or drainage improvement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

sequences ABA08255-ABA09374 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence of the invention activities; the polypeptides of the invention may have various activities; stem cell growth factor activity; hammunomodulatory activity; tissue growth activity; hammunomodulatory activity; activit, tissue growth activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; ancer cell proliferation or metastasis.

Thrombolytic activities; ancer cell proliferation or metastasis.

Depending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conduitions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), artherial isohaemia hone disorders (e.g., myeloid or lymphone), and almorated or corrected the activities of arthritis), artherial isohaemia hone disorders (e.g., myeloid or lymphone), and almorated e.g., and alm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   reterial isotalemy, auneroscierosis, coronary neart disease, arterial isotalemia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound haling (e.g., of burns, incisions and ulcers), while those with cimmunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders. Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelal cells that can be used to augment or replace cells damaged by illness, that can be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human to polypeptide of the invention.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by construct and disorders include SAPHO Syndrome (synovitis, acne, pustulosis, hypertosis and osteomyclitis), uveitis and endophthalmitis. Practuosis, hypertosis and osteomyclitis), uveitis and the central carries associated with an infections of bone, joints and the central esions associated with acne vulgaries. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that plands to the proteins of the invention of sumple with a binding agent that pland protein in the sample. The polypeptides may be used as antigens in the production of antibodies of specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and convention and activity of P. acnes proteptides and diagnostic agents for determining P. acnes presence, for example, by carry in the sequence data for this patent did not form part of the printed car finked immunosorbent assay (ELISA).

Converse the sequence data for this patent did not form part of the printed at ftp.wipo.int/pub/published_pct_sequences.

The human Duffy protein can be a gp-fy-alpha or a gp-fy-beta protein. The peptides are used to protect against malaria. They pecifically inhibit the invasion of red blood cells by malarial They pecifically inhibit the invasion of red blood cells by malarial The peptides can also be used to generate antibodies, complementary peptides and drugs modelled on their tertiary structures, and are all essentially useful in treatment of malaria and in the regulation of essential erythrocyte, neural and renal functions.

Peptides AAW62589-91 have amino acid sequences characteristic of a Duffy protein (DP) and specific binding affinity for malarial Duffy-binding ligand (MDBL). The human Duffy protein can be a gp-Fy-alpha or a gp-Fy-beta protein. The peptides are used to protect against malaria. They pecifically inhibit the invasion of red blood cells by malarial parasites, specifically merozoites of Plasmodium vivax and P. knowlesi.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The peptides can also be used to generate antibodies, complementary peptides and drugs modelled on their tertiary structures, and are all potentially useful in treatment of malaria and in the regulation of essential erythrocyte, neural and renal functions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       group; antigen; alpha; beta; cell; malaria; treatment.
                                                                                                                                                                                                                                                                                      New peptide(s) from Duffy protein that bind to malarial Duffy binding ligand - used to protect against infection by malarial parasites, particularly Plasmodium vivax or Plasmodium knowlesi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid encoding gp-Fy, Duffy antigen proteins - used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The N-terminal region of the gpD protein has been identified as being involved in the interaction of the malaria parasite with the red cell. This peptide binds the Rubinstein antibody which is a monoclonal antibody specific for the gpD protein. The fact that this peptide along with those of AAR73957-58 bind the Rubinstein antibody whereas AAR73959-61 do not suggest that the junction between the C-terminal of peptide AAR73951 and the N-terminal of AAR73959 is important for binding. This peptide binds the parasite in vivo and, therefore, can be used as the immunogen in a vaccine against malaria.
                                                                                                                                                                 Duffy blood group; malaria; Plasmodium vivax; glycoprotein; gpD; cytokine receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an optionally immobilised multi-enzyme complex prepared by specific binding with cohensin-dockerin on cellulose bound protein. An optionally immobilised protein carrier molecule has plural repetitive enzyme bound domains (C) capable of binding with a carrier molecular bound domains (C) capable of binding with a carrier molecular bound domain (D) of cellulose degrading enzyme, in which the cellulose bound protein contains intact cellulose bound domain (CBD) or the carrier having replaced plural synaptonemal enzyme domains (e.g. C1, C2) with different binding properties. The immobilised multi-enzyme complex is useful for various medicine and food industries. the sequence listing from the present invention, but not defined further within the specification.
                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immobilized multi-enzyme complex, optionally modified, and a method
prevent vivax malaria and to regulate erythrocyte, neural or renal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Clostridium; multienzyme complex; immobilised body; carrier; food; cohensin-dockerin; cellulose bound protein; medicine.
                                                                                                                                                                                                                                                         ö
                                                                                                                                             complementary peptides and drugs
                                                                         The sequence is that of a peptide which specifically binds the anti-Fy6 antibody, which blocks penetration of P.vivax merozoites into human erythrocytes in vitro. The peptide may thus be useful in preventing malaria and may also be modelled on its tertiary structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 23; DB 21; Length 67; 100.0%; Pred. polymeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PECR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PECR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymetide are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating tisorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA2135). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ttp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human brain expressed single exon probe encoded protein SEQ ID NO: 35743.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protein #8045 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human feetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                           Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                            The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                             for analyzing gene expression in human

```

```
probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide #10598 encoded by probe for measuring placental gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences
                                                                                                                                                                                                                                              Human peptide encoded by genome-derived single exon probe SEQ ID 35381.

or the eukarypote; and (D) desecting specific hypothesation of desectably labeled nucleic acids from eukarypote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon in several microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORP). The probes are used for gene or probes/open reading frames (ORP). The probes are used for gene or south as asthman lung derived mRNA and for the study of lung diseases such as asthma, lung disease (ILD), familial idiopathic pulmonary (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary intensitial lung disease (ILD), familial idiopathic pulmonary (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary hamonary alveolar proteinosis, karagener syndrome, sarcoidosis, pulmonary disease, bulmonary displasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein or encoded by a single exon probe of the invention. ö (b) detecting specific hybridisation of detectably Trigonopsis variabilis D-amino oxidase; Trigonopsis variabilis CBS 4095; high yields of D-amino acid oxidase; enzyme. Sequence encoded by of Trigonopsis variabilis D-amino acid oxidase gene, Using the DNA, (AAN81684) D-aminoacid oxidase (D-AO)can be prepd. in a Gaps D-amino acid oxidase (I) gene - derived from Trigonopsis variabilis ö Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Length 69; Indels 100.0%; Score 23; DB 23; 100.0%; Pred. No. 3.5e+02; Disclosure; Fig 2, pages 551; 12pp; Japanese. 0; Mismatches ftp.wipo.int/pub/published_pct_sequences. Ą Trigonopsis variabilis CBS 4095.                        high yield. A wide range of applications is possible. The whole DNA was extd. from T. variabilis CBS 4095 by Cryer's method. 40 ug of the DNA C state. Its reacted with 4 units of the restriction enzyme MboI at 37 degrees C for 15 min. The reaction liquor is extracted with phenol./Chloroform C electrophoresis and electro-elution and dissolved in 20 ul of 0.1 fold concn. of TE buffer soln. (III) to give a soln. (IV). 30 ug of Vector C c nord. of TE buffer soln. (III) to give a soln. (V). (IV) and (V) c nord. If of 0.0 concn. of (III) to give a soln. (V). (IV) and (V) c nord. The vector and CBS 4095. A bNA library is prepd. The c are mixed in a ratio of 3:1 and reacted with T4-DNA ligase to combine the c mino gp. terminal AA sequence of D-AO is determined. A DNA probe is synthesized. Candidates of the D-AO-clone are selected and sepd. from the C synthesized. Candidates of the D-AO-clone are selected and sepd. from the c determined. D-AO gene is modified. A generation vector is prepd. and the C D-AO gene is smodified. A generation vector is prepd. and the C D-AO gene is generated. D-MELIA in the continual continual in the continual

The sequences can be used in the traptiment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a protein of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed uspecification, but was obtained in electronic format directly from the USPIO web site.
                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences of a number of human reproductive system related antiyens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention.
                                                                                                                                                       Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated nucleic acid encoding a Staphylococcus epidermidis polypeptide, useful for diagnosing and treating bacterial infections

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypetide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from DNA. The sequences were analysed for ORP of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To indentify likely H. pylori antigenes for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant and determined the sequences of interest, particular regions can be production to the pylori by pcR miplification for recombinant polypeptide production, e.g. in E. coli hosts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Andersen C,
                                                                                                           detergent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            activity
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, oplymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The chair first and in recombinant production of (II). The chair if the consistence of the fidentifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II), (I) and (II) are useful in medical in gene in protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in casponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human crown and part of the sequence of the invention.

CNOTE: The sequence data for this patent did not appear in the printed sequences.

Specification, but was obtained in electronic format directly from WIPO control format the printed control of the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and 'encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

Sequence

```
cc residues 132 and 133 (all numbering according to the subtilisin BPN sequence (BASBPN)) or (ii) at least 1 amino acid (aa) modification at positions corresponding to G159, S164, I165, V167, R170 or Y171 of BLS309, by substitution, insertion or deletion of at least 1 of the residues 129-136 so that autoproteolysis stability is increased, and the compositions together with a cellulase, lipse, cutinase, oxidoreductase, another protease or amylase. The other components are of shandard surfacterates, builders or bleaches. A typical granular fabric cleaning composition comprises 6.5% sodium 12C alkylbenzenesulphonate; 15% Na2 sulphate; 26% zeolite A; 5% Na nitrilotriacetate; 0.1% of the subtilase variant; 0.5% poly(vinyl-perborate monohydrate; 0.1% of the subtilase variant; 0.5% poly(vinyl-perborate monohydrate; 0.1% phenol sulphonate and minor components to make 100%. The subtilase variants are used in laundry and dishwashing detergents also in fabric softeners and hard-surface cleaners. Increased resistance to autoproteolysis results in greater proteolytic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardlovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;

                                     Treferred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABM15762 to ABM2725 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide syndrome associated with ORFX-associated disorder. ORFX polynucleotide treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester disease, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple solerosis, rheumatoid as multiple sesses, autoimmune disorders such as multiple solerosis, rheumatoid as multiple solerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3. The sequence data for this patent did not form part of the printed ecification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          20-MAY-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            21-MAY-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                24-MAY-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  25-MAY-1999
                                                                                                                                                                                    The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polypuncleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related of sorders. Such conditions include ovarian cancer and breast cancer, and clasorders (e.g., infertility, disorders of pregnancy, anovulation.) activation or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation.) and covarian or breast crimers, such on the production of clasorders (e.g., chlamydia, HIV, toxoplasmosis, and toxic disorders, infertions (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and immunodeficiencies, autoimmune ophoritis, systemic lupus erythematosus), blood-related disorders (e.g., champing), cardiovascular disorders, and unimary system disorders, neurological disorders, gastrointestinal disorders, and unimary system disorders, ovarian antigen polypeptides and conditions (e.g., diamemia), cardiovascular disorders, and unimary system disorders, ovarian inscreening for compounds which further be used for gene therapy, chromosome mapping, in the printed that the covarian antigen expression or activity. The polynucleotides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and and phenotyping. The printed sequence represents a human ovarian antigen of the invention.

Sequence represents a human ovarian antigen of the invention.

Sequence represents a human ovarian antigen of the invention.

Sequence represents a human ovarian antigen of the printed specification, but was obtained or sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                        Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 8, Application US/08140797
Patent No. 5578714
GENERAL INFORMATION:
APPLICANT: POGO, Angel Oscar; Chaudhuri, Asok
TITLE OF INVENTION: THE CLONING OF DUFFY BLOOD GROUP ANTIGEN
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sprung Horn Kramer & Woods
STREE: 660 White Plains Road
CITY: Tarrytown
STATE: New York
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 23; DB 2; Length 64; 100.0%; Pred. No. 1.1e+02;

Sequence 92, Application US/08871355A
Patent No. 6015669
GENERAL INFORMATION:
APPLICANT: David William Holden
TITLE OF INVENTION: Identification of Genes
NUMBER OF SEQUENCES: 501
CORRESPONDENCE ADDRESS:

; HYPOTHETICAL: US-08-871-355A-92

```
GENERAL INFORMATION:
APPLICANT: BRILES, David E.
APPLICANT: BRILES, David E.
TITLE OF INVENTION: IMMUNOGENIC COMPOSITIONS FOR MUCOSAL ADMINISTRATION OF TITLE OF INVENTION: INMUNOCOCCAL SURFACE PROTEIN A (PSPA)
FILE REFERENCE: 454312-2018
CURRENT APPLICATION NUMBER: US/08/446, 201B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match 100.0%; Score 23; DB 3; Length 288; Best Local Similarity 100.0%; Pred.
